Work History

Chief Technology Officer at Proyecto Educa, Remote

December 2025 to Current

- Applied five years of production TypeScript and Node.js experience to own backend architecture, data models, deployment, and production support for education platforms, turning unclear operational needs into maintainable services and releases.
- Defined API contracts, authentication rules, database changes, and integration boundaries with product contributors so new workflows could ship without weakening security or existing user operations.
- Led distributed contributors through written plans, GitHub code reviews, automated tests, and release checks, keeping technical decisions clear for both engineers and non-technical stakeholders.

Principal Software Engineer at Free2Z, Remote

April 2025 to April 2026

- Built and operated production backend services with TypeScript, Node.js tooling, Python, Django REST APIs, and PostgreSQL for a live startup product used by real customers.
- Integrated third-party meeting, recording, and account services through REST APIs, verified webhooks, and asynchronous workflows so external events reached the correct user records.
- Protected payment and balance-changing workflows with webhook signature checks, idempotency, atomic PostgreSQL updates, durable event receipts, retries, and audit records so duplicate or partial events could not corrupt user state.
- Improved PostgreSQL schema and query performance through safe migrations, concurrent indexing, SQL diagnostics, and concurrency tests while keeping production traffic available.
- Operated Dockerized services and event-driven infrastructure on GCP with Pub/Sub, CI/CD, production logs, health gates, failure alerts, and automatic rollback so integrations remained observable and recoverable.

Product Engineer at U.S. Department of State via AVAA, Remote

November 2024 to August 2025

- Built Bilingua Talent as the sole engineer with TypeScript, Node.js, REST APIs, and PostgreSQL after mapping an undocumented workflow with advisors and employers.
- Designed the relational schema, migrations, validation rules, role-based access, and service boundaries for candidates, advisors, employers, and administrators so each group could work from one consistent system.
- Shipped and supported a live pilot through application logs, diagnostic SQL, regression checks, and stakeholder demos, turning user feedback and production issues into safer onboarding and reporting workflows.

- Built, deployed, and maintained internal services with TypeScript, Node.js, PostgreSQL, Prisma, Auth.js, and Azure, replacing spreadsheet-heavy operations for approximately 300 scholars, advisors, and staff.
- Designed relational schemas, migrations, permissions, validations, payment records, receipts, and reports so program teams could manage participant services from reliable data.
- Diagnosed production and data failures with application logs, SQL, Python validation scripts, cleanup workflows, and user walkthroughs, then documented fixes for faster support and safer releases.

Selected Backend and Integration Systems

Zrode - Open-Source Agent Development Environment

TypeScript, React, Node.js, WebSockets

- Built a Node.js WebSocket service, typed event protocol, and React client so multiple coding-agent providers could run through persistent sessions in one developer workflow.
- Added session orchestration, checkpoints, runtime logs, health checks, and automated tests so interrupted agent runs remained observable, reproducible, and recoverable.

Brio - Mobile Agent Control Plane

Go, React Native, PostgreSQL

- Built Go companion and relay services with a shared protocol, device pairing, PostgreSQL session state, routing, action logs, and health checks so a persistent agent could be controlled safely across devices.

Cyber Incident Verification Agent

Python, Playwright, HTTP, PDF extraction

- Built a Python research pipeline that ingested incident records, generated targeted searches, fetched public sources, and rendered blocked or JavaScript-heavy pages with Playwright so analysts could verify incidents against direct evidence.
- Added staged requests, timeouts, retries, fallback fetchers, caches, source scoring, and explicit rejection reasons so unreliable websites and weak search results did not become accepted evidence.

Open Source

Contributor to Hermes Agent, Orca, and Zed

July 2026 to Current

- Contributed agent-setup, prompt-preservation, session, and editor fixes through public issues, regression tests, GitHub code review, and maintainer feedback.

Education

- M.P.A. from IESA (Instituto de Estudios Superiores de Administracion), in progress Expected 2027
