Work History

Chief Technology Officer at Proyecto Educa, Remote

December 2025 to Current

- Owned product direction, full-stack architecture, implementation priorities, deployment, and production support for education platforms, turning unclear operator needs into maintainable releases.
- Defined API contracts, data models, authentication rules, integration boundaries, and failure handling, then selected implementation approaches based on product risk and delivery speed.
- Led distributed contributors through written plans, GitHub code reviews, automated tests, and release checks so the team could ship quickly without lowering its engineering standards.

Principal Software Engineer at Free2Z, Remote

April 2025 to April 2026

- Built and modernized customer-facing publishing, search, CMS, live-video, and AI-writing features across TypeScript, JavaScript, React, Python, Django REST APIs, and PostgreSQL.
- Shipped an AI writing assistant using prompt design and retrieved product activity as context, then corrected prompt and context failures from observed usage so creators received useful drafts inside their workflow.
- Hardened Pub/Sub and webhook services with signature verification, idempotency, durable event records, retries, concurrency tests, and explicit failure handling so duplicate events did not corrupt user state.
- Operated Dockerized services on GCP with CI/CD, production logs, health checks, deployment gates, and automatic rollback so releases remained observable and recoverable.

Product Engineer at U.S. Department of State via AVAA

November 2024 to August 2025

- Built Bilingua Talent as the sole engineer with Next.js, React, TypeScript, Node.js, REST APIs, and PostgreSQL after mapping an undocumented workflow with advisors and employers.
- Designed user-facing flows, multi-tenant data models, RBAC, validations, and reports for candidates, employers, advisors, and administrators, then improved them through demos and a live pilot.
- Used browser traces, application logs, diagnostic SQL, and regression tests to reproduce production failures, fix root causes, and explain technical decisions to non-technical stakeholders.

Work History (continued)

Software Developer at AVAA, Remote

October 2022 to July 2024

- Built, deployed, and maintained SEP and SEA with TypeScript, React, Node.js, PostgreSQL, Prisma, Auth.js, and Azure, replacing spreadsheet-heavy operations for approximately 300 scholars, advisors, and staff.
- Designed relational schemas, migrations, permissions, validations, dashboards, and reports so program teams could complete daily work from consistent data instead of manual reconciliation.
- Diagnosed production and data failures with application logs, SQL, Python validation scripts, cleanup workflows, and user walkthroughs, then documented fixes for faster support and safer releases.

Selected AI and Open-Source Engineering

Zrode - Open-Source Agent Development Environment

TypeScript, React, Node.js, WebSockets

- Built an interface and WebSocket service for multiple coding-agent providers with persistent sessions, typed events, checkpoints, runtime logs, health checks, and automated tests so developers could inspect and recover agent workflows.
- Used Zrode to test multi-provider routing, tool execution, session recovery, and AI-assisted development workflows, then improved the product from failures found during daily use.

Brio - Mobile Interface for Hermes Agent

Go, React Native, PostgreSQL

- Built Brio primarily as a mobile app interface for Hermes Agent, using React Native with Go companion and relay services so users could access and control a persistent Hermes session from another device.
- Added device pairing, per-user ownership, session routing, action logs, and health checks so remote agent sessions could be monitored and recovered safely.

RegistroCiberVE Research and Incident Verification Agent

Python, Playwright, LLM APIs

- Built a tool-calling agent with retrieval, structured outputs, browser automation, source evaluation, retries, fallbacks, and human review to verify web and PDF evidence while controlling latency and API cost.

Zed and Orca - Open-Source Contributions

Rust, TypeScript, Automated Testing

- Contributed fixes covering editor behavior, terminal focus, Git state, settings, LSP, Markdown navigation, Windows agent setup, and stale SSH sessions through public issues, regression tests, and maintainer review.

Education

- M.P.A. from IESA (Instituto de Estudios Superiores de Administracion), in progress Expected 2027
